Solicitation W51AA1-26-Q-A097

Questions and Answers

1. Per PWS Section 4.1, should offerors assume the full quantity of 400 runs will be performed during each contract year for pricing purposes?

   Yes, please provide pricing for 400 drops annually.

2. If actual LAN/Ethernet quantities are less than the stated maximum of 400 runs in a contract year, will the annual firm-fixed price for PWS Section 4.1 remain unchanged, or will payment be adjusted based on actual quantities performed?

   This pricing will remain unchanged.

3. If available, can the Government provide historical annual quantities from the current contract for the following:

   The requirement has changed since the last contract. The number of drops, fiber cable runs and splicing, as well as remedial maintenance was derived from historical amounts and what is required from this effort. No BBLAN cable and components have been removed during previous contract. The decommissioning of the BBLAN is new to this requirement.

4. PWS Section 4.2 identifies up to 10 fiber runs and up to 5 fusion-splicing events annually. Should offerors price the annual firm-fixed amount assuming the full stated maximum quantities will be performed each year?

   Yes, we are asking for pricing for up to 10 fiber runs and 5 fusion-splicing events annually.

5. The PWS references removal of approximately 31 miles of BBLAN cable and 2,126 total components. Can the Government confirm whether approximately 31 miles of cable is expected to be removed during each annual period, for an estimated total of approximately 155 miles over five years, or whether 31 miles represents the total existing BBLAN cable inventory to be removed over the full contract period?

   31 miles of cable and 2126 components are the totals to be removed by completion of the five-year contract. Therefore, we are looking to have approximately 1/5 of this amount removed each year with full removal by contract completion.

6. If the BBLAN removal workload is intended to be divided across the five contract years, can the Government provide the anticipated annual quantity of cable and components to be removed?

   Approximately 6.2 miles of cable and 425 components annually.

7. Can the Government provide additional information regarding the typical location and accessibility of the existing BBLAN cable scheduled for removal? For example, is the cable primarily located in cable trays, above ceilings, within conduit, underground or manhole pathways, or other areas?

   The majority of coaxial cable will be located above ceilings and within walls, though all locations listed in the question also have cables.

8. Are existing drawings, pathway diagrams, or other documentation available that identify the BBLAN cable routes and locations?

   This documentation does exist and will be provided to the awardee. Due to CUI markings, it is not releasable.

9. Regarding removed BBLAN equipment and components, can the Government clarify the contractor's responsibilities for transportation and delivery to Building 96? Additionally, is a separate DD Form 1348 required for each individual component, or may similar items be grouped where appropriate?

   The contractor will uninstall BBLAN components and cable and transport them to building 96 for turn in. Along with the components, a complete DD 1348 must accompany the components to be turned in. You can put multiple units of the exact same item on one sheet, provided they share the same NSN and the same Supply Condition Code. For example, if you are turning in 50 of the exact same model of node tap (same NSN, same condition), they can go on a single sheet with a quantity of "50".

10. For the remedial maintenance requirements, can the Government define the applicable "business hours" associated with the six-business-hour onsite response requirement and the 18-business-hour restoration requirement? Are after-hours, weekend, or holiday response requirements anticipated?

    No. Business hours take place during business days; weekends, holidays, and after-hours responses are not required.

11. The PWS establishes an annual limit of 40 hours for water removal activities. Is there an anticipated or historical annual quantity of labor hours, service calls, or trouble tickets for the remaining remedial maintenance requirements?

    40 hours of remedial maintenance is expected annually to cover trouble tickets, including the water removal activities.

12. Can the Government confirm what Government-furnished equipment may be available for contractor use, including lifts, ladders, pathway access equipment, or other equipment necessary to perform cable installation and removal activities?

    A bucket lift will be provided for contractor use.

13. Attachment II appears to calculate the FAR 52.217-8 six-month extension using one-half of the Option Year 2 total. Can the Government confirm whether this is the intended calculation or whether the extension should be based on one-half of the final option year pricing?

    Updated Pricing sheet attached

14. Given the use of NAICS 238210 and the service-related nature of the requirement, can the Government clarify which limitation on subcontracting requirement and applicable percentage will govern performance of this contract?

    Please see FAR clause 52.219-14

15. The PWS includes a number of safety and environmental requirements, including confined space, fall protection, lockout/tagout, hot work, UXO awareness, and construction and demolition waste diversion. Can the Government clarify which of these requirements are anticipated to routinely apply to the LAN installation, repair, and BBLAN removal activities under this contract?

    Each will be relevant at different times, and it's important that the Contractor work with our Safety personnel to ensure they are getting the latest Safety/Environmental information and standards available.
